

Are Urinary Problems Interfering with the Quality of Your Life?

Do you have frequent urination?

Do you often wake at night to urinate?

Do you have the sensation of not emptying your bladder?

If so, you may be one of the millions of men suffering from a condition called Benign Prostatic Hyperplasia (BPH) that causes the prostate to enlarge. Urologists at TRI VALLEY UROLOGY are conducting a research study to evaluate an investigational drug to help reduce Overactive Bladder (OAB) symptoms in men with BPH. Qualified participants must currently be taking tamsulosin (medication for BPH).

Basic qualifications are:

- Males, 40 years or older
- Currently taking tamsulosin
- In general good health

If you qualify, you may receive:

- Study related exams at no cost
- Reimbursement of your study-related travel
